CISA

ISACA

ISACA CISA (Certified Information Systems Auditor)

The CISA practice exam is written and formatted by Certified Senior IT Professionals working in today's prospering companies and data centers all over the world! The CISA Practice Test covers all the exam topics and objectives and will prepare you for success quickly and efficiently. The CISA exam is very challenging, but with our CISA questions and answers practice exam, you can feel confident in obtaining your success on the CISA exam on your FIRST TRY!

ISACA CISA Exam Features

- Detailed questions and answers for CISA exam
- Try a demo before buying any ISACA exam
- CISA questions and answers, updated regularly
- Verified CISA answers by Experts and bear almost 100% accuracy
- CISA tested and verified before publishing
- CISA examcollection vce questions with exhibits
- CISA same questions as real exam with multiple choice options

Acquiring ISACA certifications are becoming a huge task in the field of I.T. More over these exams like CISA exam are now continuously updating and accepting this challenge is itself a task. This CISA test is an important part of ISACA certifications. We have the resources to prepare you for this. The CISA exam is essential and core part of ISACA certifications and once you clear the exam you will be able to solve the real life problems yourself.Want to take advantage of the Real CISA Test and save time and money while developing your skills to pass your ISACA CISA Exam? Let us help you climb that ladder of success and pass your CISA now!

DEMO EXAM

QUESTION: 1
The difference between a vulnerability assessment and a penetration test is that a vulnerability assessment:

A. searches and checks the infrastructure to detect vulnerabilities, whereas penetration testing intends to exploit the vulnerabilities to probe the damage that could result from the vulnerabilities.
B. and penetration tests are different names for the same activity.
C. is executed by automated tools, whereas penetration testing is a totally manual process.
D. is executed by commercial tools, whereas penetration testing is executed by public processes.

Answer: A

Explanation:
The objective of a vulnerability assessment is to find the security holds in the computers and elements analyzed; its intent is not to damage the infrastructure. The intent of penetration testing is to imitate a hacker's activities and determine how far they could go into the network. They are not the same; they have different approaches. Vulnerability assessments and penetration testing can be executed by automated or manual tools or processes and can be executed by commercial or free tools.

QUESTION: 2
The most common problem in the operation of an intrusion detection system (IDS) is:

A. the detection of false positives.
B. receiving trap messages.
C. reject-error rates.
D. denial-of-service attacks.

Answer: A

Explanation:
Because of the configuration and the way IDS technology operates, the main problem in operating IDSs is the recognition (detection) of events that are not really security incidents-false positives, the equivalent of a false alarm. An IS auditor needs to be aware of this and should check for implementation of related controls, such as IDS tuning, and incident handling procedures, such as the screening process to know if an event is a security incident or a false positive. Trap messages are generated by the Simple Network

Management Protocol (SNMP) agents when an important event happens, but are not particularly related to security or IDSs. Reject-error rate is related to biometric technology and is not related to IDSs. Denial-of-service is a type of attack and is not a problem in the operation of IDSs.

QUESTION: 3
Which of the following provides no repudiation services for e-commerce transactions?

A. Public key infrastructure (PKI)
B. Data Encryption Standard (DES)
C. Message authentication code (MAC)
D. Personal identification number (PIN)

Answer: A

Explanation:
PKl is the administrative infrastructure for digital certificates and encryption key pairs. The qualities of an acceptable digital signature are: it is unique to the person using it; it is capable of verification; it is under the sole control of the person using it; and it is linked to data in such a manner that if data are changed, the digital signature is invalidated. PKl meets these tests. The Data Encryption Standard (DES) is the most common private key cryptographic system. DES does not address no repudiation . A MAC is a cryptographic value calculated by passing an entire message through a cipher system. The sender attaches the MAC before transmission and the receiver recalculates the MAC and compares it to the sent MAC. If the two MACs are not equal, this indicates that the message has been altered during transmission; it has nothing to do with no repudiation. A PIN is a type of password, a secret number assigned to an individual that, in conjunction with some other means of identification, serves to verify the authenticity of the individual.

QUESTION: 4
While copying files from a floppy disk, a user introduced a virus into the network. Which of the following would MOST effectively detect the existence of the virus?

A. A scan of all floppy disks before use
B. A virus monitor on the network file server

C. Scheduled daily scans of all network drives
D. A virus monitor on the user's personal computer

Answer: C

Explanation:
Scheduled daily scans of all network drives will detect the presence of a virus after the infection has occurred. All of the other choices are controls designed to prevent a computer virus from infecting the system.

QUESTION: 5
Which of the following message services provides the strongest evidence that a specific action has occurred?

A. Proof of delivery
B. Nonrepudiation
C. Proof of submission
D. Message origin authentication

Answer: B

Explanation:
Nonrepudiation services provide evidence that a specific action occurred. Nonrepudiation services are similar to their weaker proof counterparts, i.e., proof of submission, proof of delivery and message origin authentication. However, nonrepudiation provides stronger evidence because the proof can be demonstrated to a third party. Digital signatures are used to provide nonrepudiation . Message origination authentication will only confirm the source of the message and does not confirm the specification that has been completed.

QUESTION: 6
The PRIMARY objective of Secure Sockets Layer (SSL) is to ensure:

A. only the sender and receiver are able to encrypt/decrypt the data.
B. the sender and receiver can authenticate their respective identities.
C. the alteration of transmitted data can be detected.
D. the ability to identify the sender by generating a one-time session key.

Answer: A

Explanation:
SSL generates a session key used to encrypt/decrypt the transmitted data, thus ensuring its confidentiality. Although SSL allows the exchange of X509 certificates to provide for identification and authentication, this feature along with choices C and D are not the primary objectives.

QUESTION: 7
The role of the certificate authority (CA) as a third party is to:

A. provide secured communication and networking services based on certificates.
B. host a repository of certificates with the corresponding public and secret keys issued by that CA.
C. act as a trusted intermediary between two communication partners.
D. confirm the identity of the entity owning a certificate issued by that CA.

Answer: D

Explanation:
The primary activity of a CA is to issue certificates. The primary role of the CA is to check the identity of the entity owning a certificate and to confirm the integrity of any certificate it issued. Providing a communication infrastructure is not a CA activity. The secret keys belonging to the certificates would not be archived at the CA. The CA can contribute to authenticating the communicating partners to each other, but the CA is not involved in the communication stream itself.

QUESTION: 8
Which of the following is a distinctive feature of the Secure Electronic Transactions (SET) protocol when used for electronic credit card payments?

A. The buyer is assured that neither the merchant nor any other party can misuse their credit card data.
B. All personal SET certificates are stored securely in the buyer's computer.
C. The buyer is liable for any transaction involving his/her personal SET certificates.
D. The payment process is simplified, as the buyer is not required to enter a credit card number and an expiration date.

Answer: C

Explanation:
The usual agreement between the credit card issuer and the cardholder stipulates that the cardholder assumes responsibility for any use of their personal SET certificates for e-commerce transactions. Depending upon the agreement between the merchant and the buyer's credit card issuer, the merchant will have access to the credit card number and expiration date. Secure data storage in the buyer's computer (local computer security) is not part of the SET standard. Although the buyer is not required to enter their credit card data, they will have to handle the wallet software.

QUESTION: 9
E-mail traffic from the Internet is routed via firewall-1 to the mail gateway. Mail is routed from the mail gateway, via firewall-2, to the mail recipients in the internal network. Other traffic is not allowed. For example, the firewalls do not allow direct traffic from the Internet to the internal network.
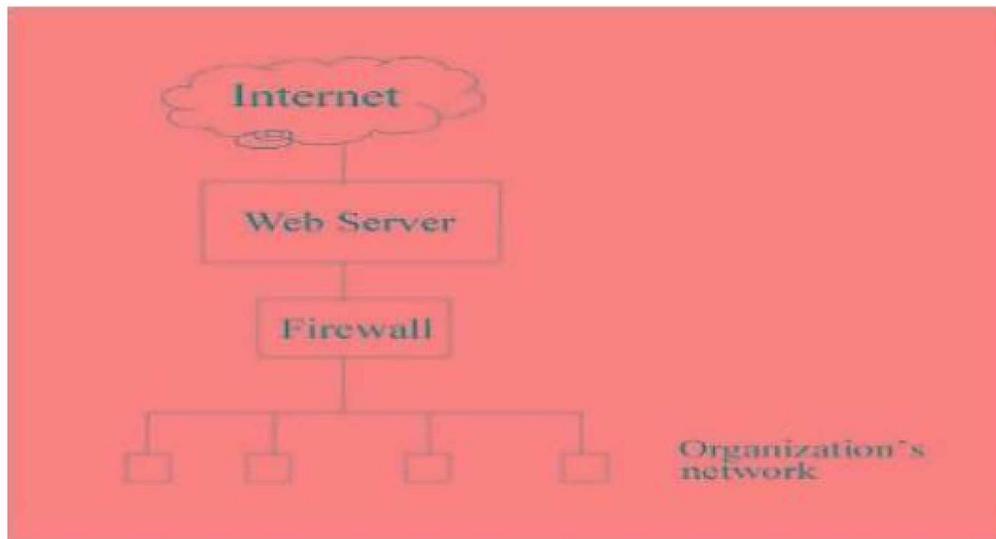

The intrusion detection system (IDS) detects traffic for the internal network that did not originate from the mail gateway. The FIRST action triggered by the IDS should be to:

A. alert the appropriate staff.
B. create an entry in the log.
C. close firewall-2.
D. close firewall-1.

Answer: C

Explanation:
Traffic for the internal network that did not originate from the mail gateway is a sign that firewall-1 is not functioning properly. This may have been be caused by an attack from a hacker. Closing firewa!l-2 is the first thing that should be done, thus preventing damage to the internal network. After closing firewall-2, the malfunctioning of firewall-1 can be investigated. The IDS should trigger the closing of firewall-2 either automatically or by manual intervention. Between the detection by the IDS and a response from the system administrator valuable time can be lost, in which a hacker could also compromise firewall-2. An entry in the log is valuable for later analysis, but before that, the IDS should close firewall-2. If firewall-1 has already been compromised by a hacker, it might not be possible for the IDS to close it.

QUESTION: 10
An IS auditor should be MOST concerned with what aspect of an authorized honeypot?

A. The data collected on attack methods
B. The information offered to outsiders on the honeypot
C. The risk that the honeypot could be used to launch further attacks on the organization's infrastructure
D. The risk that the honeypot would be subject to a distributed denial-of-service attack

Answer: C

Explanation:
Choice C represents the organizational risk that the honeypot could be used as a point of access to launch further attacks on the enterprise's systems. Choices A and B are purposes for deploying a honeypot , not a concern. Choice D, the risk that thehoneypot would be subject to a distributed denial-of-service (DDoS) attack, is not relevant, as the honeypot is not a critical device for providing service.

QUESTION: 11
Which of the following should be a concern to an IS auditor reviewing a wireless network?

A. 128-bit static-key WEP (Wired Equivalent Privacy) encryption is enabled.
B. SSID (Service SetIDentifier) broadcasting has been enabled.
C. Antivirus software has been installed in all wireless clients.
D. MAC (Media Access Control) access control filtering has been deployed.

Pass4sure Certification Exam Features;

- Pass4sure offers over **2500** Certification exams for professionals.
- More than **98,800** Satisfied Customers Worldwide.
- Average **99.8%** Success Rate.
- Over **120** Global Certification Vendors Covered.
- Services of Professional & Certified Experts available via support.
- Free 90 days updates to match real exam scenarios.
- Instant Download Access! No Setup required.
- Price as low as $19, which is 80% more cost effective than others.
- Verified answers researched by industry experts.
- Study Material **updated** on regular basis.
- Questions / Answers are downloadable in **PDF** format.
- Mobile Device Supported (Android, iPhone, iPod, iPad)
- **No authorization** code required to open exam.
- **Portable** anywhere.
- *Guaranteed Success*.
- **Fast**, helpful support 24x7.
