QUESTION: 4

An administrator has formed a High Availability cluster involving two FortiGate 310B units. [Multiple ipstream Layer 2 switches] - [FortiGate HA Cluster] - [Multiple downstream Layer 2 switches] The administrator wishes to ensure that a single link failure will have minimal impact upon the overall throughput of traffic through this duster. Which of the following options describes the best step the administrator can take?

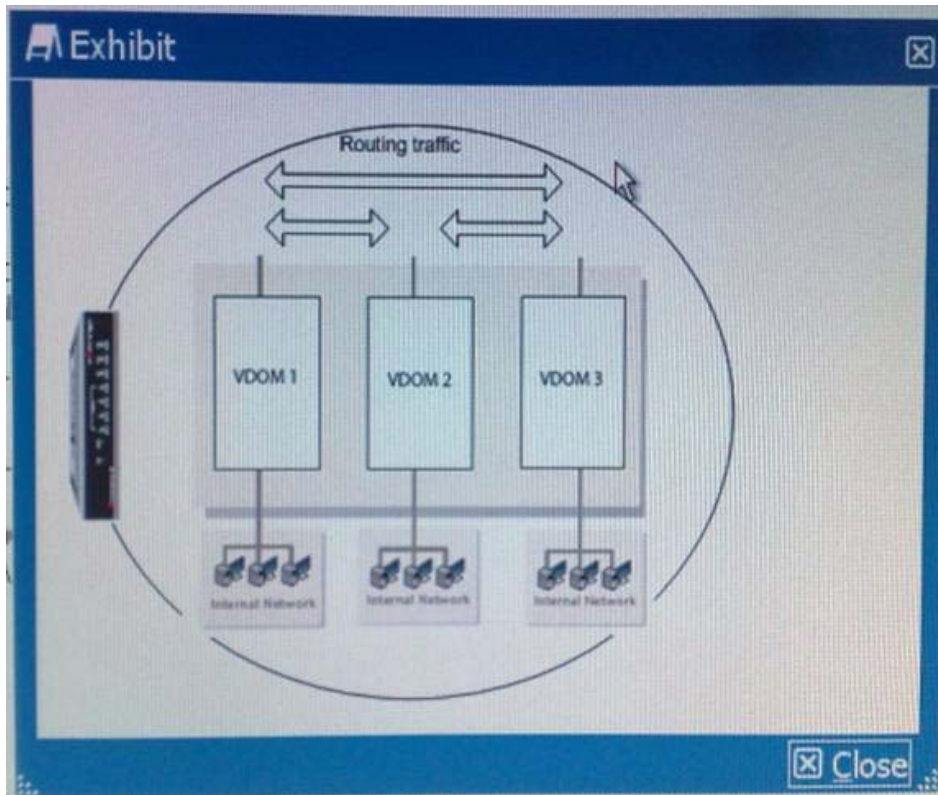

The administrator should...

- A. setup a full-mesh design which uses redundant interfaces.
- B. increase the number of FortiGate units in the cluster and configure HA in Active-Active mode.

FortiGate unit is configured with three Virtual Domains (VDOMs) as illustrated in the exhibit.

Which of the following statements are true if the network administrator wants to route traffic between all the VDOMs? (Select all that apply.)

- A. The administrator should configure inter-VDOM links to avoid using external interfaces and routers.
- B. As with all FortiGate unit interfaces, firewall policies must be in place for traffic to be allowed to pass through any Interface, including inter-VDOM links. This provides the same level of security internally as externally.
- C. This configuration requires the use of an external router.
- D. Inter-VDOM routing is automatically provided if all the subnets that need to be routed are locally attached. As each VDOM has an independent routing table, routing rules need to be set (for example, static routing, OSPF) in each VDOM to route traffic between VDOMs.
